

DHT™-4C

“DHT™-4C” is dehydrated Hydrotalcite-like Compound and has the unique anion-exchange property.

“DHT™-4C” has been developed for use as stabilizer in the resins processing at high temperature such as engineering plastics and rubbers.

“DHT™-4C” is more suitable for use in the resins processing at high temperature, because the heat resistance of “DHT™-4C” is higher than “DHT-4A™-2”.

【Typical Data】

			DHT™-4C
Molar Ratio of MgO/Al ₂ O ₃			4.25
Loss on heating (300°C × 1Hr)		(%)	4.1
Specific Surface Area (BET)		(m ² /g)	15
Particle Size Distribution			
Average	%50	(μm)	0.38

Package	NET weight
Paper bag	15 kg
